The prostate cancer antigens can have neuroprotective, cytostatic,
                                                                                                                                  AAT03999-T04001 are all human cDNA sequences which code for pancreatic trypsin III (AAR87203), the sequences differ only in their stop codons. The cDNA molecules can be used in the recombinant production of trypsin which can be used as a drug to treat diseases wherein trypsin production is impaired.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human prostate cancer antigen nucleotide sequence SEQ ID NO:310.

                                                                                                                                                                                                                                                                                                                                                                       AAT03999-T04001 are all human cDNA sequences which code for pancreatic trypsin III (AAR87203), the sequences differ only in their stop codons. The cDNA molecules can be used in the recombinant production of trypsin which can be used as a drug to treat diseases wherein trypsin production is impaired.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The DNA encodes the rat caldecrin preprosequence (see AAR90682). Expression vectors conty, the DNA can be used for the recombinant production of caldecrin from transformant host cells. The caldecrin is used as a serum calcium lowering agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding rat and human caldecrin and related vectors – for prodn. of caldecrin for use as serum calcium lowering agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Revised entry submitted to correct sequence analysis breakdown.)

cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome fidentification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel nucleic acid (cDNA) sequences (A) which have anticancer activity and are highly expressed in ovarian tumor tissue (and some also in testis and breast cancer tissue). The products of the invention can be used for gene therapy. (A) are used (i) for ceombinant expression of polypeptides (B) and (ii) to isolate complete genes, (B) are used (i) to including expression of polypeptides (B) and (ii) to isolate complete ovarian cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the caper to be revealed, so should reduce the number of fallures associated with the fact that ESYs from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of cocurrence in a particular tissue. Aas77450-17572 represent the human ovarian tumor cDNA library derived ESY fragments represented in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present sequence represents a Helicobacter pylori amif open reading frame from an example from the present invention. The present invention describes H. pylori aliphatic amidase AmiE Polypeptides and antibodies form immunogenic, pharmaceutical and therapeutic compositions which can be used in methods for detecting, treating or preventing Helicobacter sp. (particularly H. pylori and H.helimanii) infections, especially chronic gastroduodenal disorders like gastritis, dyspepsia and peptic ulcers in man, and porcine gastric ulcers in pigs. They are administered in immunologically/pharmaceutically effective amounts by an oral, intradermal, intramuscular, intravenous or mucosal route to a patient. A detection Xit for a Helicobacter infection comprises any AmiE polynucleotides with any of the vectors given in the corpusion, and the proposated and isobutyramide. The polypeptides are used to screen for active substrates that inhibit Helicobacter sp. amidase activity. The polynucleotides encoding the aliphatic amidase are the first to be characterized at the molecular level. Methods involving such polypeptides are preferred to urease-based contact and a process of a certain and such polypeptides are preferred to urease-based contactorial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GHPO protein; Helicobacter infection; gastroduodenal disease; gastritis; peptic ulcer disease; ss.

                                                                                                                                                                                                                                                                                          This sequence represents a polynucleotide of the invention. It was isolated from Helicobacter pylori and encodes a H.pylori GHPO protein. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The genes encoding the GEP polypeptides are useful molecular tools for identifying similar genes in pathogenic microorganisms, such as pathogenic strains of Bacillus. In addition, the operons containing genes encoding GEP and the polypeptides themselves, are useful targets for identifying compounds that are inhibitors of the pathogens in which the GEP are expressed. Such inhibitors are useful for inhibiting bacterial growth by being bacteriostatic or bacteriocidal.
                                                                                                                                                                                                                                                                                    Streptococcus pneumoniae general essential protein genes and proteins, useful for identification of antibacterial agents -

Sequence 42, Application US/08896164

Patent No. 6218521

GENERAL INFORMATION:

APPLICANT: OBATA, Yuichi

TITLE OF INVENTION: WITH GASTRIC CANCER AND METHODS FOR

TITLE OF INVENTION: DIAGNOSING AND TREATING GASTRIC CANCER

NUMBER OF SEQUENCES: 87

Sequence 8, Application US/0929332C

; Patent No. 6232110
; GENERAL INFORMATION:
; GENERAL INFORMATION:
; APPLICANT: Pallas, David C
; APPLICANT: Du, Xianxing
; TITLE OF INVENTION: Coding Sequence for Protein Phosphatase Methylesterase,
; Patent No. 6232110
; PATENT OF INVENTION: RECOmbinant DNA Molecules and Methods
; FILE REFERENCE: 105-97
; CURRENT APPLICATION NUMBER: US/09/293,322C
; CURRENT APPLICATION NUMBER: US 60/082,202
; PRIOR FILING DATE: 1998-04-16
; PRIOR FILING DATE: 1998-04-17
; NUMBER OF SEQ ID NOS: 17
; SOFTWARE: PatentIn Ver. 2.0
; SEQ ID NO 8
; MUNDER OF SEQ ID NOS: 17
; LENTH: 2409

Patent No. 6307020
GENERAL INFORMATION:
APPLICANT: Hew, Choy
APPLICANT: Gong, Zhiyuan
TITLE OF INVENTION: Intracellular Antifreeze Polypeptides
TITLE OF INVENTION: and Nucleic Acids
NUMBER OF SEQUENCES: 46
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SOFTWARE: Patentin Release #1.0, Version #1.30 CURRENT APPLICATION DATA:

Patent No. 5766879
GENERAL INFORMATION:
APPLICANT: SYNAPTIC PHARMACEUTICAL CORPORATION
TITLE OF INVENTION: DNA ENCODING 5-HT4 SEROTONIN RECEPTORS
TITLE OF INVENTION: DNA ENCODING 5-HT4 SEROTONIN RECEPTORS
TITLE OF INVENTION: DNA ENCODING 5-HT4 SEROTONIN RECEPTORS
TITLE OF INVENTION: AND USES THEREOF
NUMBER OF SEQUENCES: 15
CORRESPONDENCE ADDRESS: 600HAM
STREET: 30 ROCKEFELLER PLAZA
CITY: NEW YORK
STREET: BUW YORK
ZITE: 10.112
COMPUTER READABLE FORM:
MEDIUM TYPE: Flopy disk
COMPUTER: TIM FC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOCTWARE: Petentin Release #1.30
CURRENT APPLICATION DATA: BOS/08/46,822
FILING DATE: June 1, 1995
CLASSIFICATION NUMBER: 28,678
RECISTRATION NUMBER: 28,678
RELEPHONE: (212) 278-0400
TELEPHONE: CHARACTERISTICS:
LENGTH: 1622 base pairs
TYPE: nucleic acid
STRANDEDRESS: double

polylinker; Site_I: Not I: Site_E. Eco RI; The UI-R-CAI
polylinker; Site_I: Not I: Site_I: Ro RI; The UI-R-CAI
library is a subtracted library derived from the following
tissues: thalands, cerebellum, hypothalamus, medula, pons
tissues: thalands, cerebellum, corpus striatum, testis, and
hippocampus. For a detailed description of the library
from which this clone was derived, please visit our web
site at ratest.eng.ulowa.edu. The subtraction has been
previously described in (Bonaldo, Lennon and Soares,
                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Email: msoares@blue.weeg.utowa.edu
The sequence contained an oligo-dr track that was present in the
squence contained an oligo-dr track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
trail. The sequence tag present in the cDNA between the Noti site
and the oligo-dr track served to identify it as a clone from the
normalized hypothalamus library probNA Library Preparation: M.B.
Soares Lab clone distribution: clones will be available through
Research Genetics (www.resgen.com) The following repetitive
elements were found in this cDNA sequence: 7-360, >RMERIB#Unknown

//note-*Organ: Kidney/Brain; Vector: pBACe3.6; Site_1:
ECORI; Site_2: ECORI; Female C57BL/6J mouse kidney and/or
brain genomic DNA was isolated and partially digested
with a combination of ECORI and ECORI Methylase. Size
selected DNA was cloned into the pBACe3.6 vector at the
ECORI sites. The ligation products were transformed into
DH10B electrocompetent cells (BRL Life Technologies). "

                                                FEATURES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TITLE
```

a

```
ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 k range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chancally-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note="Organ: Kidney/Brain; Vector: pBACe3.6; Site_1:
EcoRI; Site_2: EcoRI; Female C57BL/6J mouse kidney and/or
brain genomic DNA was isolated and partially digested
with a combination of EcoRI and EcoRI Methylase.
Selected DNA was cloned into the pBACe3.6 vector at the
EcoRI sites. The ligation products were transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Jacobs., Nierman, W., Feldblyum, T., Malek, J., Shatsman, S., Akinret, B., Levins, M., Mcgann, S., Tsegaye, G., Geer, K., Krol, M., de Jong, P. and Fraser, C.M.

Submitted (12.APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at

Inducatory Mouse DNR Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polywucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (qil47321141gb]AR129072.1), a copy number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
